Product Data Sheet; Model DFA-1333B1 Wide-Coverage V/UHF Fixed-Site Sleeve-Dipole Adcock Radio Direction Finding Antenna

FEATURES

- 108-520 MHz Continuous Frequency Coverage
- **Fixed-Site Sleeve-Dipole Mast-Mount Design**
- **True Adcock Does Not Use Inferior Loops**
- Self-Decoupled From Support Tower Or Mast
- 2.5 Degrees Typical RMS Bearing Accuracy
- **High Signal Handling Capability**
- Rugged, Weather-Sealed Design
- **Built-in RS-232 Personality ID Module**

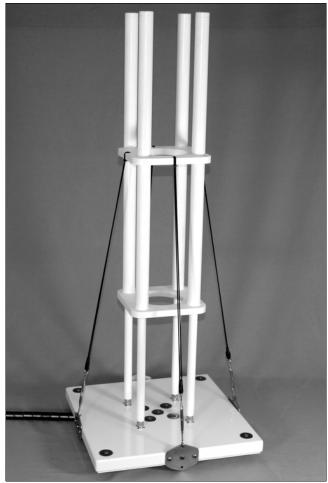

DESCRIPTION

The RDF Products Model DFA-1333B1 is a 4-aerial UHF sleeve-dipole Adcock single-channel radio direction finding antenna continuously covering 108-520 MHz. This rugged, weather-sealed unit is specifically designed for permanent or transportable fixed-site DF applications, and is readily mast- or tower-mounted.

Being of a true Adcock design, the DFA-1333B1 avoids the erratic performance associated with inferior loop DF antennas and provides sensitivity and listen-thru capability superior to that of comparable pseudo-Doppler DF antennas. The DFA-1333B1 has also been designed for high signal-handling capability for reliable performance in dense signal environments.

The DFA-1333B1 has been specially designed so that its performance is independent of its supporting mast or tower (this is accomplished with the supplied isolation mast). This is in sharp contrast to competing mastmounted DF antenna designs where performance is adversely and unpredictably affected not only by the presence of the mast, but also by changes in mast height.

The DFA-1333B1 directly interfaces with all RDF Products DF receivers and bearing processors via a single 8-meter interface cable (routed through the isolation mast). Custom interface cables with user speci-

DFA-1333B1 108-520 MHz Sleeve-Dipole Adcock DF Antenna (close-up without 5' iso-mast)

fied lengths are also available. The aerials are removable to facilitate storage, transport, and user testing. The isolation mast can likewise be removed.

The DFA-1333B1 includes a digital "personality ID module" that reports model number and frequency coverage information for this DF antenna. connected to any of the RDF Products "B"-series DF processors/receivers (e.g., the DFP-1000B, DFP-1010B, or DFR-1000B), the DFA-1333B1 automatically reports its model number and frequency coverage information. This information is then displayed so that the user can easily avoid out-of-band operation.

SPECIFICATIONS (subject to change without notice)

DF Technique: Single-channel 2-phase Adcock (derived sense)

Frequency Coverage: 108-520 MHz continuous

Bearing Accuracy: 2.0 degrees RMS VHF;

2.5 degrees RMS UHF;

(typical, ideal siting

conditions)

Polarization: Vertical

Output Impedance: 50 ohms nominal +36/+25 dBm typical (V/UHF: referenced to

derived sense input)

derived sense input)

3rd Order Intercept: +25/+15 dBm typical (V/UHF; referenced to

DFA-1333B1 - Page 2

Power Requirements: 11-16 VDC @ 90 mA (negative ground)

Operating Temperature: -40 to +60 degrees C
Storage Temperature: -40 to +70 degrees C

Humidity: 0-100%

Structural Weight:

Dimensions: 121.5"x20.5"x20.5" (HxWxD, w/5' iso-mast and 24" support pipe)

66 lbs. (includes main chassis, aerials, isomast, 8-meter interface cable; excludes 14 lbs. stainless-steel mast

support pipe)

APPLICATIONS INFORMATION

Most mast-mounted DF antenna designs fail to take the necessary steps to decouple (isolate) the supporting mast from the antenna. The close proximity of the mast to the aerials results in antenna gain pattern distortion that degrades bearing accuracy and sensitivity. This performance degradation is not only unpredictable, but its severity greatly changes as a function of mast height.

The problem is most noticeable with wide-coverage DF antennas and most acutely manifests itself as frequency "holes" (narrow and sometimes not-so-narrow frequency bands where severe performance degradation is experienced). In addition, these "holes" tend to shift in frequency when the mast height is changed or the unit is installed at a different location. Furthermore, these "holes" are actually just the extreme manifestation of the broader problem that some degree of performance degradation exists over all or most of the DF antenna's frequency range as a consequence of inadequate mast decoupling. Users are often unaware of these problems, however, attributing them instead to site anomalies or the vagaries of radio direction finding in general. The problem is further compounded by the reluctance of most vendors to fully meet their duty of candor to customers to disclose this serious performance shortcoming.

In fact, these problems actually occur as a result of a design deficiency that is overcome in RDF Products mast-mounted DF antennas. All such DF antennas manufactured by RDF Products have been specifically designed so that the aerials are properly decoupled from the supporting mast, thus eliminating the above-mentioned mast-induced performance degradations. DF antenna performance is thus unaffected by the mast and there are no frequency "holes".

DFA-1333B1 Mounted on 5' Iso-Mast
